

## AMENDMENTS TO THE CLAIMS

The listing of claims replaces all prior versions, and listings, of claims in the application:

### Listing of Claims

1. (Currently amended) A method for associating information pertaining to consumption of a utility commodity, the method comprising:

receiving information corresponding to ~~the~~ a provider of the utility commodity  
and at least one entity that receives the utility commodity from the  
provider;

forming a tree comprised of a root node and at least one leaf node emanating from  
the root node, the root node corresponding to the provider and the at least  
one leaf node corresponding to the at least one entity;

associating a meter proxy with the at least one leaf node, the meter proxy  
containing data from meter readings, the meter proxy comprising an  
interface to data generated by a physical utility meter;

associating at least some of the received information corresponding to the  
provider and the at least one entity with the root ~~nodes~~ node and the at  
least one leaf node, respectively, and

associating actions relating to the providing of ~~one of~~ the utility commodity with  
each of the nodes based on the received information associated therewith.

2. (Original) The method of claim 1, wherein the meter proxy provides meter change information regarding the physical utility meter.

3. (Original) The method of claim 1, wherein the meter proxy provides data relating to load profiles regarding the physical utility meter.

4. (Currently amended) The method according to claim 1, further comprising the steps of:

segmenting the tree into segments having at least one node therein;

assigning a unique identifier to each of the segments;

~~associated~~ associating at least one segment, ~~if necessary,~~ with the at least one user

based on the identifier of the at least one segment; and

allowing the at least one user access to only the at least one segment that the user is associated with.

5. (Original) The method of claim 1 further comprising associating the meter proxy with a set of active elements and associating the set of active elements with the at least one leaf node.

6. (Original) The method of claim 1 wherein the meter proxy further comprises an interface to data generated by an electricity meter.

7. (Currently amended) A system comprising:

a data acquisition system operable to acquire energy consumption data from a plurality of electricity meters;

a storage device operable to store at least some of the acquired energy consumption data;

a data processing system operably coupled to the storage device, the data processing system operable to receive information corresponding to a provider of energy and at least one entity that receives one of the energy from the provider;

form a tree comprised of a root node and at least one leaf node emanating from the root node, the root node corresponding to the provider and the at least one leaf node corresponding to the at least one entity;

associate energy consumption data with at least one node of the tree;

associate at least some of the received information corresponding to the provider and the at least one entity with the root ~~nodes~~ node and the at least one leaf node, respectively, and

associate actions relating to the providing of one of the utility commodity with each of the nodes based on the received information associated therewith.

8. (Original) The system of claim 7, wherein the data processing system is further operable to associate a meter proxy to the at least one node of the tree, the meter proxy comprising an interface to the energy consumption data stored in the storage device.

9. (Original) The system of claim 8, wherein the meter proxy is further associated with a physical electricity meter.

10. (Original) The system of claim 9, wherein the meter proxy provides meter change information regarding the physical electricity meter.

11. (Original) The system of claim 9, wherein the meter proxy provides data relating to load profiles regarding the physical electricity meter.

12. (Original) The system of claim 11, wherein the data processing system is further operable to generate time of use metering information based on the data relating to load profiles from the meter proxy, the time of use metering information including charges for energy consumption based on the time period in which the energy was consumed.

13. (Original) The system of claim 7, wherein the data processing system is further operable to generate time of use metering information based on the energy consumption data, the time of use metering including charges for energy consumption based on the time period in which the energy was consumed.

14. (Original) A method for associating information pertaining to consumption of a utility commodity, the method comprising:

receiving information corresponding to the provider, at least one parent entity that has at least one subordinate entity that receives the utility commodity from the provider, and the at least one subordinate entity;

forming a tree comprised of a root node, at least one branch node emanating from the root node, and at least one leaf node emanating from the at least one branch node, the root node corresponding to the provider, the at least one branch node corresponding to the at least one parent entity, and the at least one leaf node corresponding to the at least one subordinate entity;

associating a meter proxy with at least one node, the meter proxy containing data from meter readings, the meter proxy comprising an interface to data generated by a physical utility meter;

associating at least some of the received information corresponding to the provider, the at least one parent entity, and the at least one subordinate entity with the root node, the at least one branch node, and the at least one leaf node, respectively, and

associating actions relating to the providing of one of the utility commodity with each of the nodes based on the received information associated therewith.

15. (Original) The method according to claim 14, wherein the at least one parent entity receives the utility commodity.

16. (Original) The method according to claim 14, wherein at least one of the at least one branch node and the at least one leaf node is associated with at least one contract pertaining to the utility commodity provided by the provider.

17. (Original) The method according to claim 14, wherein at least one of the at least one branch node and the at least one leaf node is associated with reports that specify billing to be paid the provider for providing the utility commodity.

18. (Original) The method according to claim 14, further comprising the step of generating an input mapping for a given action that maps a data type of the meter proxy with a data type compatible with the given action.

19. (Currently amended) The method according to claim 18, further comprising ~~comprising~~ the step of interconnecting some of the actions associated with any of the nodes to form a sequence of actions necessary to accomplish a given task.

20. (Original) The method according to claim 19, wherein said given task comprises generating a billing report.

21. (Original) The method according to claim 14, further comprising: obtaining energy consumption data from the physical utility meter; storing energy consumption data in a data storage; and associating the energy consumption data in the data storage

with the meter proxy; providing an input mapping of a data format of the energy consumption data employed by the meter proxy to a data format of a given task.
